buat aplikasi inventory management system dengan menggunakan kode html, css, js, php, sql. Gunakan kode front-end memakai index.html, style.css, script.js. (lengkapi dengan penjelasan struktur kode yang sesuai dengan struktur folder, serta tutorial penggunaannya)

Struktur Folder:

```
bash

inventory-management/
├── index.html      # Halaman utama (front-end)
├── style.css       # Gaya tampilan
├── script.js       # Logika interaktif
├── config.php      # Konfigurasi database
├── functions.php   # Fungsi CRUD
├── add_item.php    # Tambah item ke database
├── issue_item.php  # Mengeluarkan item dari stok
├── inventory.sql   # Struktur database
└── assets/        # Folder untuk gambar atau ikon
```

ChatGPT can make mistakes. Check important info.

1. Database (inventory.sql)

Buat database dengan nama `inventory_db` lalu gunakan skrip berikut untuk membuat tabel:

```
CREATE DATABASE inventory_db;
```

```
USE inventory_db;
```

```
CREATE TABLE items (
  id INT AUTO_INCREMENT PRIMARY KEY,
  name VARCHAR(255) NOT NULL,
  description TEXT,
  cost DECIMAL(10,2) NOT NULL,
  quantity INT NOT NULL,
  available INT NOT NULL
);
```

2. Konfigurasi Koneksi (config.php)

```
php

<?php
$host = "localhost";
$user = "root";
$pass = "";
$dbname = "inventory_db";

$conn = new mysqli($host, $user, $pass, $dbname);

if ($conn->connect_error) {
    die("Koneksi gagal: " . $conn->connect_error);
}
?>
```

<?php

\$host = "localhost";

\$user = "root";

\$pass = "";

\$dbname = "inventory_db";

\$conn = new mysqli(\$host, \$user, \$pass, \$dbname);

if (\$conn->connect_error) {

die("Koneksi gagal: " . \$conn->connect_error);

}

?>

3. Fungsi CRUD (functions.php)

php

Copy

Edit

```
<?php
include 'config.php';

function getInventory() {
    global $conn;
    $sql = "SELECT * FROM items";
    $result = $conn->query($sql);
    return $result;
}

function issueItem($id) {
    global $conn;
    $sql = "UPDATE items SET available = available - 1 WHERE id = $id AND available > 0";
    return $conn->query($sql);
}
```

<?php

include 'config.php';

function getInventory() {

 global \$conn;

 \$sql = "SELECT * FROM items";

 \$result = \$conn->query(\$sql);

 return \$result;

}

function issueItem(\$id) {

 global \$conn;

 \$sql = "UPDATE items SET available = available - 1 WHERE id = \$id AND available > 0";

 return \$conn->query(\$sql);

}

?>

4. Halaman Utama (index.html)

```
html

<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <title>Inventory Management</title>
  <link rel="stylesheet" href="style.css">
</head>
<body>
  <h1>Inventory</h1>
  <table>
    <thead>
      <tr>
        <th>ID</th>
        <th>Item Name</th>
```

Ask anything

5. Gaya Tampilan (style.css)

```
css

body {
  font-family: Arial, sans-serif;
  margin: 20px;
}

h1 {
  text-align: center;
}

table {
  width: 100%;
  border-collapse: collapse;
  margin-top: 20px;
}
```

Ask anything

6. Logika Front-End (script.js)

```
js                                                                    Copy Edit

document.addEventListener("DOMContentLoaded", function() {
    fetchInventory();
});

function fetchInventory() {
    fetch("functions.php")
    .then(response => response.json())
    .then(data => {
        let table = document.getElementById("inventoryTable");
        table.innerHTML = "";

        data.forEach(item => {
            let row = `<tr>
                <td>${item.id}</td>
                <td>${item.name}</td>
            `;
            table.innerHTML += row;
        });
    });
}
```

7. Mengeluarkan Item (issue_item.php)

```
php                                                                    Copy Edit

<?php
include 'functions.php';

if (isset($_GET['id'])) {
    $id = $_GET['id'];
    if (issueItem($id)) {
        echo "Item issued successfully!";
    } else {
        echo "Failed to issue item!";
    }
}

?>
```
